

Jeroen Derks

Software engineer — PHP, Laravel, backend, security

Selected work, 2004–2026 — 14 projects

Screenshots marked web.archive.org are Internet Archive captures, showing those sites as they stood during the engagement rather than today. Where a screenshot shows something other than the work described, the card says so. Every project title, screenshot and link pill in this document is clickable.

Reveal URLs

Spot phishing links before you click.

A phishing email hides a hostile destination behind trustworthy-looking link text. Sometimes it is a look-alike host: the text reads `paypa.l.com` while the link points at `paypa1.com`. Often it is subtler, routing through a tracker or redirector, so where you land is nothing like the brand named in the text. Reveal URLs shows the URL each link really points to, so the mismatch is plain to see.

This is not hypothetical. The message below is a real phishing email dressed up as a parcel-delivery notice from a postal service:

Your parcel will not be released for

01 Reveal URLs

2025 — now

Own product

Browser extension and mail add-on that shows each link's real destination, so a phishing mismatch is plain to see. Runs entirely locally, no tracking.

We treat codebases *ruined by AI.*

The **Vibe-Coding Detox Klinik** is a specialist consultancy for organisations whose web applications have developed an unfortunate dependency on autocomplete. Founded by a senior engineer with 30 years of clean diagnoses, we offer rehabilitation, re-architecture, and — when prognosis is severe — a dignified rewrite.

Take the Assessment →

An improved approach to Cloud

[Know Why](#)
[Get a Beta!](#)

STACKSCALE IS A PREMIUM PRIVATE CLOUD PROVIDER BASED IN AMSTERDAM, THE NETHERLANDS.

Virtualization, which led to the Cloud era, brought us lots of advantages but still had many disadvantages when used in multi-tenant shared environments.

Today, technology around virtualization has greatly improved, both in the hardware area and in the software, with the emerging of large-scale community supported strong Cloud related software components.

Stackscale aims to join the best of the current state-of-the-art hardware and software and deliver it at a fair price, passing on to our customers the savings that can be achieved by using those technologies.

We strongly believe in automation, open source software and a friendly, highly skilled and efficient customer support, which jointly are the ways to deliver a great product with a very competitive price.

WHO IS STACKSCALE FOR?

- Companies or projects that demand lots of computing resources, since the minimum you will get from us is a dedicated and exclusive physical node with 128GB of RAM.
- Hosting providers that want to add a competitive Public Cloud offering to their portfolio. We have many options to resell our Private Cloud in slices to third parties.
- Any company that spends more than 500€ a month in its hosting provider should consider moving to Stackscale. The more your current hosting expenditure is, the more savings you achieve with us.

Stackscale product is still under development and will be ready for immediate setup during Q4 this year. In the meantime, you can apply to get a Beta account by clicking here.

HIGH QUALITY SOFTWARE DEVELOPMENT

Trojan Scan

Latest Linux/BSD version (1.6.0)

Older versions

Read about Trojan Scan in this article:

[CLI Magic: Trojan Scan](#)

Trojan Scan is crafted in the finest Unix tradition [...] [www.linux.com](#)

Trojan Scan is a simple shell script that allows for simple but relatively effective checking for trojans, rootkits and other malware that may be using your server and network for unwanted (and possibly illegal) purposes. Since this script is relatively simple don't expect it to catch them all, but it helps to find these programs on e.g. shared servers. On those machines lots of users install many kinds of applications. These applications may introduce new vulnerabilities which would perhaps otherwise not be detected if not for a very alert sysadmin.

It works by listing all process that use the Internet with the *Isof* command (using *-PnI* flags). This list is then transformed into signatures in the form of `<process_name>:<protocol>:<port_number_in>:<port_number_out>:<user>`. These signatures then are matched against the allowed process defined in the configuration. If any signatures of running processes are found that do not match the allowed signatures, an email report is sent including *ps*, *ls*, and optional *Isof* output (see also: *Isof*).

The script is relatively easy in use:

1. Install into `/etc/trojan-scan/trojan-scan.conf` and `/usr/local/sbin/trojan-scan.sh`
2. Use the following to generate a default configuration:

```
trojan-scan -C /etc/trojan-scan/trojan-scan.conf
```

 or,

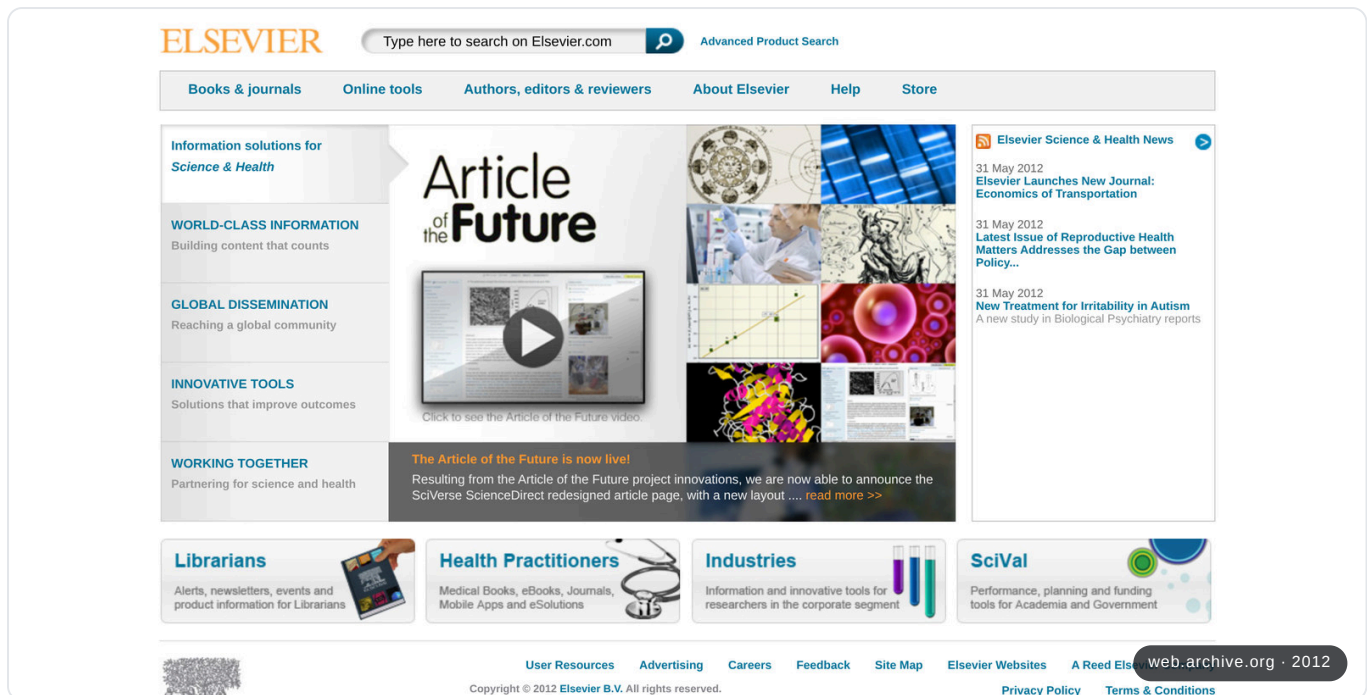

08 Trojan Scan

2005 — 2014

Own project

A tool to scan servers regularly for unwanted processes. Featured on Linux.com at the time.
